

## Weekly Update

### **Planes and Automobiles – March 3, 2025**

The reality of air travel is that it does not start and stop on the plane—getting to and from the airport counts too, and the new Pittsburgh International Airport is designed to make the entire travel day simpler.

Construction teams raised the first set of canopies for the Transportation Network Company lot, better known as the area outside the ground level of the new terminal where rideshares and taxis will pick up passengers.

This milestone punctuates the importance of easing the passenger journey through design—both in creating a dedicated space for passengers to catch their rides efficiently and separating foot traffic from those that may be driving away in their own vehicles from the new surface lots or Multi-Modal Complex.

## Flying Through Our New Terminal in 2025

The new Pittsburgh International Airport saw its first drone flight of 2025.
